# Word2Vec - Introduction

Read the following Wikipedia excerpt first:

*"Word2vec is a group of related models that are used to produce word embeddings. These models are shallow, two-layer neural networks that are trained to reconstruct linguistic contexts of words. Word2vec takes as its input a large corpus of text and produces a vector space, typically of several hundred dimensions, with each unique word in the corpus being assigned a corresponding vector in the space. Word vectors are positioned in the vector space such that words that share common contexts in the corpus are located in close proximity to one another in the space."*

Now, watch the following two videos:

- ▶ **1- Quick Intro Explanation**
- ▶ **2 -Detailed Stanford Lecture (0:00 - 42:30)**

2020-05-31

CS156 - Final Project

└ Word2Vec - Introduction

└ Word2Vec - Introduction

the videos are crucial in order to get started with jargon, terms and intuitions.

You might won't understand some of the jargon; that's OK. The idea is to start getting familiar with the #context and the terms. By the end of these lectures you should be able to answer the following questions:

- ▶ What is a "one-hot" representation? What is its major drawback?
- ▶ What is the distribution of similarity, and why it is important?
- ▶ What is a "one-hot" representation?
- ▶ Fill in the blank, and explain: "You shall know a word by \_\_\_it \_\_\_".

2020-05-31

CS156 - Final Project

└ Word2Vec - Introduction

└ Introduction - Continued

## CS156 - Final Project

### Word2Vec - Introduction

### Examples

## Examples - Continued

You can see that with Word2Vec we can map words into word embeddings using dimension-reduction, to preserve and find new semantic insights.

Motivating Questions:

- ▶ What are the benefits of this model, and in which instances will it fail?
- ▶ Recall - what are dimension-reduction techniques you have learned so far in CS156?
- ▶ What are dangerous implications of such a model, if it were to be widely accepted and implemented in the AI industry?

# Activation Functions:

*"...[T]he activation function of a node defines the output of that node given an input or set of inputs." (Wikipedia)*

## Function Types:

**Sigmoid:** A classic one that has been used is the Sigmoid, the same one used for logistic regression (and from there, we understand that it makes sense to use it, as it is used for classification, and fits "fire" - "don't fire" task).

**Definition:** 
$$S(x) = \frac{1}{1 + e^{-x}} = \frac{e^x}{e^x + 1}.$$

**Derivative:** 
$$S'(x) = S(x) \cdot (1 - S(x))$$

**Definition:** 
$$S(x) = \frac{1}{1 + e^{-x}} = \frac{e^x}{e^x + 1}.$$

**Derivative:** 
$$S'(x) = S(x) \cdot (1 - S(x))$$

## Activation Func. - Cont.

**ReLU:** Rectified Linear Unit is considered the gold standard nowadays amongst the common activation functions, nevertheless it is very simple.

**Definition:**  $f(x) = x^+ = \max(0, x)$

**Derivative\*\*:**  $f'(x) = \begin{cases} 1 & \text{if } x > 0 \\ 0 & \text{otherwise} \end{cases}$

**Leaky (better) Derivative:**  $f(x) = \begin{cases} x & \text{if } x > 0 \\ 0.01x^{***} & \text{otherwise} \end{cases}$

**Challenge question:** Why would we need the "Leaky Version"?

\*\*\*The mathematical terms would be Epsilon

2020-05-31

CS156 - Final Project

└ The Preceptron

└ Activation Functions

└ Activation Func. - Cont.

Ask what could be problematic with this piecewise function? the answer leads to the "leaky version"

Activation Func. - Cont.

# Word2Vec - Putting it All Together

**Video:** Theoretical Background

**Notebook:** Word2Vec-Gensim

To learn how the model learns, watch the Stanford lecture (00:46 onwards).

2020-05-31

CS156 - Final Project

└ Word2Vec - Putting it All Together

└ Word2Vec - Putting it All Together

Very important to tie back to perceptron and activation functions, explain how SoftMax is analogous. explain how libraries work, and why we should use them in the context of ANNs

# Caveats, Disclaimers

- ▶ Does language static or dynamic? (hint: consider the following relationships in the 1910's and 2010's: Banking - Crisis, LOL - laughter etc...)
- ▶ Reflection of the current state of language:
  - ▶ Gender, bigotry and discrimination - how could those factor into word embeddings? What are possible consequences?

2020-05-31

CS156 - Final Project

└ Caveats, Disclaimers

└ Practical / Semantical

└ Caveats, Disclaimers

There have been early attempts to point at or shed light on inherent biases in language that are manifested in word embeddings. This is of a major concern, not merely harmful potential.

- ▶ Building intuition to understand ReLU: **ReLU Tutorial**
- ▶ For further exploration, **Word2Vec original paper** is a good place to start.
- ▶ Explore the training methods of Word2Vec: **Relevant Blog Post**
